INTERSERVE Case Study

Location: Exeter
Client: Exeter Airport (Interserve)
Completed: 2005

The scheme was designed to house the maintenance and re-fit teams of FlyBe for the work to be carried out in their new 'state of the art' hangar facility at Exeter Airport.

It comprised of a 2 level mezzanine floor with a full height wipeable steel partition screen to the exposed edge. The floor was strengthened in one area to allow for a crane to be slung from the underside of the floor. This allowed heavier materials to be manoeuvred in and out of the first mezzanine level.

A clad stair tower and another open stair which provided gantry access to the main offices within the hangar.

The front screen incorporated double glazed windows, a ground floor roller shutter door and a bi-parting door on the second level to allow the crane to operate. The floor was accessed via one fully clad stair tower and another open stair which provided gantry access to the main offices within the hangar.
